

Participants application installation guide

This guide show you how to use participants app in your local computer and run it:

1- You need to download and install **nodejs** : <https://nodejs.org>.

2- Create new React application with: **Create React App**

3- Type the following instructions in your CMD:

- **npm install -g create-react-app**
- **create-react-app participants**

This will create a directory called participants inside the current folder.

Inside that directory, it will generate the initial project structure and install the dependencies:

Participants Folder:

```
|— README.md
|— node_modules
|— package.json
|— .gitignore
|— public
|   |— favicon.ico
|   |— index.html
|   |— manifest.json
|— src
|   |— App.css
|   |— App.js
|   |— App.test.js
|   |— index.css
|   |— index.js
|   |— logo.svg
|   |— registerServiceWorker.js
```

3- Delete all the files in src folder.

4- Copy the all files contained in src folder of my participants app and paste them in src folder of the new react application you created.

5- Run the participants app:

- Access to your participants app from CMD: **cd participants**
- Access to the server from CMD: **npm start**

This opens <http://localhost:3000/> in the browser where our new participants app is running.
